Maintenance Projects: Tentative Instructions for Writing User Manual

Janusz Zalewski, 1/16/2015

Each maintenance project will be evaluated based on the project demo and a write-up called User Manual. A User Manual has to include the following elements/sections:

1) Title page, with usual information lust like for previous projects, with subtitle: User Manual.
2) Section 1 titled Introduction, giving the project background, with Physical Diagram and other essential information in it.
3) Section 2 titled Instructions, giving the step-by-step instruction how to proceed to operate the device or software. This is the most extensive section of the manual and can be divided into subsections.
4) Section 3 titled troubleshooting, giving a list of potential problems and suggestions how to resolve them.

These instructions are tentative as of January 16, 2015, and may evolve after discussions of the IEEE Software Maintenance Standard and other input.
